

# CASE STUDY

## Web Hosting and Support of Oracle Primavera Software

*DRMcNatty took MWRD's legacy version of P6 Professional (16.2) and upgraded and migrated to a new version of P6 EPPM.*

### CLIENT

### PROJECT

Project Management Information System

### LOCATION

Chicago, IL

### TOOLS

Oracle Primavera Unifier

### SERVICES PROVIDED

Data Migration  
Hosting

### OVERVIEW

MWRD was looking for a vendor that could take over management of their legacy version of P6 Professional (16.2) and upgrade/migrate to a new version of P6 EPPM. Because the version was no longer supported by Oracle, it was necessary to find a vendor that could quickly stand up a newer version in a managed hosting services environment, but also provide data migration services.

### APPROACH

DRMcNatty received a copy of the MWRD legacy P6 Pro database. The development environment was set up and the data was migrated to the new version selected by MWRD. Once the migrated data was imported into the environment, MWRD users performed UAT to make sure all data and global libraries were migrated over and that the projects were available to be created or updated.

### RESULTS

In a very short time, DRMcNatty was able to set up a new environment for the new version of P6 EPPM. Once the environment was established, we were able to migrate the legacy version database to an upgraded P6 22.12 EPPM environment. The client had a handful of users perform UAT testing in both P6 EPPM and P6 Professional, in which we received a sign off to move the environment into full production. With the sign off, DRMcNatty received an updated copy of the client's database and performed the migration and upgrade for full user production use.
